

This is I (We named here), it is back seat, generally it is the basic seat in China. The valves we offered was this type before few days. B1 is the sealing surface of the seat, When installing this valve to the pipe, it is necessary to hold the sealing surface with two flanges. Compared to II, B1 is narrower than B2 (B2 is in below).

This is cheaper.

I

II

This is II(Here's an example,we call that), This is the so-called insert seat, some people also call it sleeved seat. it is not with any back. But this is still not swallowtail seat. Please see the left remarked "C", if the seat is swallowtail, Here is the plane, not bulging. Please see "D" in left picture, if it is swallowtail, here it is the slope, not a flat groove. (Insert seat on the body through this groove). But These two differences are not seen through the appearance of the valve

This is more expensive than I. If you are interested in this type, we will update the offer..
